- elicit a good clinical history and physical findings, elucidate the clinical problems based on these and discuss the differential diagnosis.
- requisition relevant laboratory tests and perform common side lab procedures.
- be familiar with common imaging techniques, their advantages, disadvantages and indications; be aware of radiation hazards and measures to protect there from.
- outline the principles of management of various diseases, including the medical and surgical procedures available.
- describe the mode of action of commonly used drugs, their doses, side effects, toxicity, indications, contraindications and drug interactions.
- have an open attitude to the newer developments in medicine to keep abreast of new knowledge.
- diagnose and provide competent initial care to medical emergencies.
- refer medical problems to secondary and tertiary care at appropriate times.
- recognize the problems arising in patients of AIDS.
